Using the GOST 28147-89, GOST R 34.11-94,  
GOST R 34.10-94, and GOST R 34.10-2001 Algorithms with  
Cryptographic Message Syntax (CMS)

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This document describes the conventions for using the cryptographic algorithms GOST 28147-89, GOST R 34.10-94, GOST R 34.10-2001, and GOST R 34.11-94 with the Cryptographic Message Syntax (CMS). The CMS is used for digital signature, digest, authentication, and encryption of arbitrary message contents.

## 1. Introduction

The Cryptographic Message Syntax [CMS] is used for digital signature, digest, authentication, and encryption of arbitrary message contents. This companion specification describes the use of cryptographic algorithms GOST 28147-89 [GOST28147], GOST R 34.10-94 [GOST3431095, GOSTR341094], GOST R 34.10-2001 [GOST3431004, GOSTR341001], and GOST R 34.11-94 [GOST3431195, GOSTR341194] in CMS, as proposed by the CRYPTO-PRO Company for the "Russian Cryptographic Software Compatibility Agreement" community. This document does not describe these cryptographic algorithms; they are defined in corresponding national standards.

The CMS values are generated using ASN.1 [X.208-88], using BER encoding [X.209-88]. This document specifies the algorithm identifiers for each algorithm, including ASN.1 for object identifiers and any associated parameters.

The fields in the CMS employed by each algorithm are identified.

### 1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

## 2. Message Digest Algorithms

This section specifies the conventions for using the digest algorithm GOST R 34.11-94 employed by CMS.

Digest values are located in the DigestData digest field and the Message Digest authenticated attribute. In addition, digest values are input to signature algorithms.

### 2.1. Message Digest Algorithm GOST R 34.11-94

The hash function GOST R 34.11-94 has been developed by "GUBS of Federal Agency Government Communication and Information" and "All-Russian Scientific and Research Institute of Standardization". The algorithm GOST R 34.11-94 produces a 256-bit hash value of the arbitrary finite bit-length input. This document does not contain the full GOST R 34.11-94 specification, which can be found in [GOSTR341194] in Russian. [Schneier95], ch. 18.11, p. 454, contains a brief technical description in English.

The hash algorithm GOST R 34.11-94 has the following identifier:

```
id-GostR3411-94 OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
gostr3411(9) }
```

The AlgorithmIdentifier parameters field MUST be present, and the parameters field MUST contain NULL. Implementations MAY accept the GOST R 34.11-94 AlgorithmIdentifiers with absent parameters as well as NULL parameters.

This function is always used with default parameters id-GostR3411-94-CryptoProParamSet (see Section 8.2 of [CPALGS]).

When the Message Digest authenticated attribute is present, the DigestedsData digest contains a 32-byte digest in little-endian representation:

```
GostR3411-94-Digest ::= OCTET STRING (SIZE (32))
```

### 3. Signature Algorithms

This section specifies the CMS procedures for the GOST R 34.10-94 and GOST R 34.10-2001 signature algorithms.

Signature algorithm identifiers are located in the SignerInfo signatureAlgorithm field of SignedData. Also, signature algorithm identifiers are located in the SignerInfo signatureAlgorithm field of countersignature attributes.

Signature values are located in the SignerInfo signature field of SignedData. Also, signature values are located in the SignerInfo signature field of countersignature attributes.

#### 3.1. Signature Algorithm GOST R 34.10-94

GOST R 34.10-94 has been developed by "GUBS of Federal Agency Government Communication and Information" and "All-Russian Scientific and Research Institute of Standardization". This signature algorithm MUST be used conjointly with the GOST R 34.11-94 message digest algorithm. This document does not contain the full GOST R 34.10-94 specification, which is fully described in [GOSTR341094] in Russian; and a brief description in English can be found in [Schneier95], ch. 20.3, p. 495.

The GOST R 34.10-94 signature algorithm has the following public key algorithm identifier:

```
id-GostR3410-94-signature OBJECT IDENTIFIER ::= id-GostR3410-94
```

id-GostR3410-94 is defined in Section 2.3.1 of [CPPK].

The signature algorithm GOST R 34.10-94 generates a digital signature in the form of two 256-bit numbers,  $r'$  and  $s$ . Its octet string representation consists of 64 octets, where the first 32 octets contain the big-endian representation of  $s$  and the second 32 octets contain the big-endian representation of  $r'$ .

```
GostR3410-94-Signature ::= OCTET STRING (SIZE (64))
```

### 3.2. Signature Algorithm GOST R 34.10-2001

GOST R 34.10-2001 has been developed by "GUBS of Federal Agency Government Communication and Information" and "All-Russian Scientific and Research Institute of Standardization". This signature algorithm MUST be used conjointly with GOST R 34.11-94. This document does not contain the full GOST R 34.10-2001 specification, which is fully described in [GOSTR341001].

The signature algorithm GOST R 34.10-2001 has the following public key algorithm identifier:

```
id-GostR3410-2001-signature OBJECT IDENTIFIER ::= id-GostR3410-2001
```

id-GostR3410-2001 is defined in Section 2.3.2 of [CPPK].

The signature algorithm GOST R 34.10-2001 generates a digital signature in the form of two 256-bit numbers,  $r$  and  $s$ . Its octet string representation consists of 64 octets, where the first 32 octets contain the big-endian representation of  $s$  and the second 32 octets contain the big-endian representation of  $r$ .

```
GostR3410-2001-Signature ::= OCTET STRING (SIZE (64))
```

## 4. Key Management Algorithms

This chapter describes the key agreement and key transport algorithms, based on the VKO GOST R 34.10-94 and VKO GOST R 34.10-2001 key derivation algorithms, and the CryptoPro and GOST 28147-89 key wrap algorithms, described in [CPALGS]. They MUST be used only with the content encryption algorithm GOST 28147-89, defined in Section 5 of this document.

#### 4.1. Key Agreement Algorithms

This section specifies the conventions employed by CMS implementations that support key agreement using both the VKO GOST R 34.10-94 and VKO GOST R 34.10-2001 algorithms, described in [CPALGS].

Key agreement algorithm identifiers are located in the EnvelopedData RecipientInfos KeyAgreeRecipientInfo keyEncryptionAlgorithm and AuthenticatedData RecipientInfos KeyAgreeRecipientInfo keyEncryptionAlgorithm fields.

Wrapped content-encryption keys are located in the EnvelopedData RecipientInfos KeyAgreeRecipientInfo RecipientEncryptedKeys encryptedKey field. Wrapped message-authentication keys are located in the AuthenticatedData RecipientInfos KeyAgreeRecipientInfo RecipientEncryptedKeys encryptedKey field.

##### 4.1.1. Key Agreement Algorithms Based on GOST R 34.10-94/2001 Public Keys

The EnvelopedData RecipientInfos KeyAgreeRecipientInfo field is used as follows:

The version MUST be 3.

The originator MUST be the originatorKey alternative. The originatorKey algorithm field MUST contain the object identifier id-GostR3410-94 or id-GostR3410-2001 and corresponding parameters (defined in Sections 2.3.1, 2.3.2 of [CPPK]).

The originatorKey publicKey field MUST contain the sender's public key.

keyEncryptionAlgorithm MUST be the id-GostR3410-94-CryptoPro-ESDH or the id-GostR3410-2001-CryptoPro-ESDH algorithm identifier, depending on the recipient public key algorithm. The algorithm identifier parameter field for these algorithms is KeyWrapAlgorithm, and this parameter MUST be present. The KeyWrapAlgorithm denotes the algorithm and parameters used to encrypt the content-encryption key with the pairwise key-encryption key generated using the VKO GOST R 34.10-94 or the VKO GOST R 34.10-2001 key agreement algorithms.

The algorithm identifiers and parameter syntax is:

```
id-GostR3410-94-CryptoPro-ESDH OBJECT IDENTIFIER :=
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)
  gostR3410-94-CryptoPro-ESDH(97) }
```

```
id-GostR3410-2001-CryptoPro-ESDH OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
gostR3410-2001-CryptoPro-ESDH(96) }
```

KeyWrapAlgorithm ::= AlgorithmIdentifier

When keyEncryptionAlgorithm is id-GostR3410-94-CryptoPro-ESDH, KeyWrapAlgorithm algorithm MUST be the id-Gost28147-89-CryptoPro-KeyWrap algorithm identifier.

```
id-Gost28147-89-CryptoPro-KeyWrap OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
keyWrap(13) cryptoPro(1) }
```

The CryptoPro Key Wrap algorithm is described in Sections 6.3 and 6.4 of [CPALGS].

When keyEncryptionAlgorithm is id-GostR3410-2001-CryptoPro-ESDH, KeyWrapAlgorithm algorithm MUST be either the id-Gost28147-89-CryptoPro-KeyWrap or id-Gost28147-89-None-KeyWrap algorithm identifier.

```
id-Gost28147-89-None-KeyWrap OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
keyWrap(13) none(0) }
```

The GOST 28147-89 Key Wrap algorithm is described in Sections 6.1 and 6.2 of [CPALGS].

KeyWrapAlgorithm algorithm parameters MUST be present. The syntax for KeyWrapAlgorithm algorithm parameters is

```
Gost28147-89-KeyWrapParameters ::=  
SEQUENCE {  
    encryptionParamSet Gost28147-89-ParamSet,  
    ukm          OCTET STRING (SIZE (8)) OPTIONAL  
}  
Gost28147-89-ParamSet ::= OBJECT IDENTIFIER
```

Gost28147-89-KeyWrapParameters ukm MUST be absent.

KeyAgreeRecipientInfo ukm MUST be present and contain eight octets.

encryptedKey MUST encapsulate Gost28147-89-EncryptedKey, where maskKey MUST be absent.

```
Gost28147-89-EncryptedKey ::= SEQUENCE {
    encryptedKey          Gost28147-89-Key,
    maskKey               [0] IMPLICIT Gost28147-89-Key
                           OPTIONAL,
    macKey                Gost28147-89-MAC
}
```

Using the secret key corresponding to the originatorKey publicKey and the recipient's public key, the algorithm VKO GOST R 34.10-94 or VKO GOST R 34.10-2001 (described in [CPALGS]) is applied to produce the KEK.

Then the key wrap algorithm, specified by KeyWrapAlgorithm, is applied to produce CEK\_ENC, CEK\_MAC, and UKM. Gost28147-89-KeyWrapParameters encryptionParamSet is used for all encryption operations.

The resulting encrypted key (CEK\_ENC) is placed in the Gost28147-89-EncryptedKey encryptedKey field, its mac (CEK\_MAC) is placed in the Gost28147-89-EncryptedKey macKey field, and UKM is placed in the KeyAgreeRecipientInfo ukm field.

#### 4.2. Key Transport Algorithms

This section specifies the conventions employed by CMS implementations that support key transport using both the VKO GOST R 34.10-94 and VKO GOST R 34.10-2001 algorithms, described in [CPALGS].

Key transport algorithm identifiers are located in the EnvelopedData RecipientInfos KeyTransRecipientInfo keyEncryptionAlgorithm field.

Key transport encrypted content-encryption keys are located in the EnvelopedData RecipientInfos KeyTransRecipientInfo encryptedKey field.

##### 4.2.1. Key Transport Algorithm Based on GOST R 34.10-94/2001 Public Keys

The EnvelopedData RecipientInfos KeyTransRecipientInfo field is used as follows:

The version MUST be 0 or 3.

keyEncryptionAlgorithm and parameters MUST be identical to the recipient public key algorithm and parameters.

`encryptedKey` encapsulates `GostR3410-KeyTransport`, which consists of encrypted content-encryption key, its MAC, GOST 28147-89 algorithm parameters used for key encryption, the sender's ephemeral public key, and UKM (UserKeyingMaterial; see [CMS], Section 10.2.6).

`transportParameters` MUST be present.

`ephemeralPublicKey` MUST be present and its parameters, if present, MUST be equal to the recipient public key parameters;

```
GostR3410-KeyTransport ::= SEQUENCE {
    sessionEncryptedKey    Gost28147-89-EncryptedKey,
    transportParameters
        [0] IMPLICIT GostR3410-TransportParameters OPTIONAL
}
```

```
GostR3410-TransportParameters ::= SEQUENCE {
    encryptionParamSet      OBJECT IDENTIFIER,
    ephemeralPublicKey      [0] IMPLICIT SubjectPublicKeyInfo OPTIONAL,
    ukm                    OCTET STRING
}
```

Using the secret key corresponding to the `GostR3410-TransportParameters` `ephemeralPublicKey` and the recipient's public key, the algorithm VKO GOST R 34.10-94 or VKO GOST R 34.10-2001 (described in [CPALGS]) is applied to produce the KEK.

Then the CryptoPro key wrap algorithm is applied to produce `CEK_ENC`, `CEK_MAC`, and `UKM`. `GostR3410-TransportParameters` `encryptionParamSet` is used for all encryption operations.

The resulting encrypted key (`CEK_ENC`) is placed in the `Gost28147-89-EncryptedKey` `encryptedKey` field, its mac (`CEK_MAC`) is placed in the `Gost28147-89-EncryptedKey` `macKey` field, and `UKM` is placed in the `GostR3410-TransportParameters` `ukm` field.

## 5. Content Encryption Algorithms

This section specifies the conventions employed by CMS implementations that support content encryption using GOST 28147-89.

Content encryption algorithm identifiers are located in the `EnvelopedData` `EncryptedContentInfo` `contentEncryptionAlgorithm` and the `EncryptedData` `EncryptedContentInfo` `contentEncryptionAlgorithm` fields.

Content encryption algorithms are used to encipher the content located in the EnvelopedData EncryptedContentInfo encryptedContent field and the EncryptedData EncryptedContentInfo encryptedContent field.

### 5.1. Content Encryption Algorithm GOST 28147-89

This section specifies the use of GOST 28147-89 algorithm for data encipherment.

GOST 28147-89 is fully described in [GOST28147] (in Russian).

This document specifies the following object identifier (OID) for this algorithm:

```
id-Gost28147-89 OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
  gost28147-89(21) }
```

Algorithm parameters MUST be present and have the following structure:

```
Gost28147-89-Parameters ::=  
SEQUENCE {  
  iv          Gost28147-89-IV,  
  encryptionParamSet   OBJECT IDENTIFIER  
}
```

```
Gost28147-89-IV ::= OCTET STRING (SIZE (8))
```

encryptionParamSet specifies the set of corresponding Gost28147-89-ParamSetParameters (see Section 8.1 of [CPALGS])

## 6. MAC Algorithms

This section specifies the conventions employed by CMS implementations that support the message authentication code (MAC) based on GOST R 34.11-94.

MAC algorithm identifiers are located in the AuthenticatedData macAlgorithm field.

MAC values are located in the AuthenticatedData mac field.

### 6.1. HMAC with GOST R 34.11-94

HMAC\_GOSTR3411 (K,text) function is based on hash function GOST R 34.11-94, as defined in Section 3 of [CPALGS].

This document specifies the following OID for this algorithm:

```
id-HMACGostR3411-94 OBJECT IDENTIFIER ::=  
{ iso(1) member-body(2) ru(643) rans(2) cryptopro(2)  
hmacgostr3411(10) }
```

This algorithm has the same parameters as the GOST R 34.11-94 digest algorithm and uses the same OIDs for their identification (see [CPPK]).

## 7. Use with S/MIME

This section defines the use of the algorithms defined in this document with S/MIME [RFC3851].

### 7.1. Parameter micalg

When using the algorithms defined in this document, micalg parameter SHOULD be set to "gostr3411-94"; otherwise, it MUST be set to "unknown".

### 7.2. Attribute SMIMECapabilities

The SMIMECapability value that indicates support for the GOST R 34.11-94 digest algorithm is the SEQUENCE with the capabilityID field containing the object identifier id-GostR3411-94 and no parameters. The DER encoding is:

```
30 08 06 06 2A 85 03 02 02 09
```

The SMIMECapability value that indicates support for the GOST 28147-89 encryption algorithm is the SEQUENCE with the capabilityID field containing the object identifier id-Gost28147-89 and no parameters. The DER encoding is:

```
30 08 06 06 2A 85 03 02 02 15
```

If the sender wishes to indicate support for a specific parameter set, SMIMECapability parameters MUST contain the Gost28147-89-Parameters structure. Recipients MUST ignore the Gost28147-89-Parameters iv field and assume that the sender supports the parameters specified in the Gost28147-89-Parameters encryptionParamSet field.

The DER encoding for the SMIMECapability, indicating support for GOST 28147-89 with id-Gost28147-89-CryptoPro-A-ParamSet (see [CPALGS]), is:

```
30 1D 06 06 2A 85 03 02 02 15 30 13 04 08 00 00  
00 00 00 00 00 00 06 07 2A 85 03 02 02 1F 01
```

## 8. Security Considerations

Conforming applications MUST use unique values for ukm and iv. Recipients MAY verify that ukm and iv, specified by the sender, are unique.

It is RECOMMENDED that software applications verify that signature values, subject public keys, and algorithm parameters conform to [GOSTR341001] and [GOSTR341094] standards prior to their use.

Cryptographic algorithm parameters affect algorithm strength. The use of parameters not listed in [CPALGS] is NOT RECOMMENDED (see the Security Considerations section of [CPALGS]).

Use of the same key for signature and key derivation is NOT RECOMMENDED. When signed CMS documents are used as an analogue to a manual signing, in the context of Russian Federal Electronic Digital Signature Law [RFEDSL], signer certificate MUST contain the keyUsage extension, it MUST be critical, and keyUsage MUST NOT include keyEncipherment or keyAgreement (see [PROFILE], Section 4.2.1.3). Application SHOULD be submitted for examination by an authorized agency in appropriate levels of target\_of\_evaluation (TOE), according to [RFEDSL], [RFLLIC], and [CRYPTOLIC].

## 9. Examples

Examples here are stored in the same format as the examples in [RFC4134] and can be extracted using the same program.

If you want to extract without the program, copy all the lines between the "|>" and "|<" markers, remove any page breaks, and remove the "|" in the first column of each line. The result is a valid Base64 blob that can be processed by any Base64 decoder.

### 9.1. Signed Message

This message is signed using the sample certificate from Section 4.2 of [CPPK]. The public key (x,y) from the same section can be used to verify the message signature.

```
0 296: SEQUENCE {  
4 9:  OBJECT IDENTIFIER signedData  
15 281:  [0] {  
19 277:   SEQUENCE {

## 11. Acknowledgements

This document was created in accordance with "Russian Cryptographic Software Compatibility Agreement", signed by FGUE STC "Atlas", CRYPTO-PRO, Factor-TS, MD PREI, Infotechs GmbH, SPRCIS (SPbRCZI), Cryptocom, R-Alpha. The aim of this agreement is to achieve mutual compatibility of the products and solutions.

The authors wish to thank:

Microsoft Corporation Russia for providing information about company products and solutions, and also for technical consulting in PKI.

RSA Security Russia and Demos Co Ltd for active collaboration and critical help in creation of this document.

Russ Housley (Vigil Security, LLC, housley@vigilsec.com) and Vasilij Sakharov (DEMONS Co Ltd, svp@dol.ru) for encouraging the authors to create this document.

Prikhodko Dmitriy (VSTU, PrikhodkoDV@volgablob.ru) for invaluable assistance in proofreading this document and verifying the form and the contents of the ASN.1 structures mentioned or used in this document.

**Intellectual Property**

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at [ietf-ipr@ietf.org](mailto:ietf-ipr@ietf.org).
